LANDSCAPER
OF THE
CAROLINA HURRICANES

Spring 2012

Warm winter temperatures this year caused our spring to arrive earlier than usual

WHAT WE HAVE DONE THIS SPRING:

- Applied fertilizer and deer off on winter annuals
- One Applications of Pre-emergence applied to all fescue and Bermuda turf.
- Applied merit (Insecticide that prevents infestations of Japanese Beetles, Aphids, and other insects) to all plants and trees.
- Applied a selective herbicide for weeds in the turf.
- Applied insecticide to control ant hills.

MAINTENANCE PLANS FOR APRIL, MAY, & JUNE

- Second application of pre-emergent fertilizer to both Bermuda and Fescue
- Removing winter annuals and replacing with summer annuals
- Watering & Fertilizing these newly planted annuals during our weekly visits
- Begin our semi-annual pruning once the spring flush is complete
- For the Bermuda properties we will apply an application of fertilizer with high nitrogen.
- During our weekly visits we will monitor the sites for insect infestation.
- For those properties that apply - turning on irrigation systems and monitoring according to municipalities requirements.

IRRIGATION SYSTEM SPRING RESTART

It's time to inspect and restart your irrigation system. We provide full service irrigation system services, including winterization, yearly maintenance, and spring restart. Please call to schedule a consultation on system maintenance or installation.

PEST CONTROL

The best pest control is having a healthy lawn, one that out-competes weeds. Herbicides were designed to control weeds and, when used prudently, will do an effective job. Of course, you can always hand pull weeds and should first explore other plant health strategies to manage weeds in your lawn. In general, most weeds can be controlled with a broadleaf post emergent like three way or trimec, however some weeds may require special treatment like drive and sedgehammer.

NUTSEGE

Treat with sedgehammer. Cutting down Irrigation can also help reduce amount of nutsedge.

CRABGRASS

The best chemical for Crabgrass and Bahia is DRIVE. Remember, don't cut too low. Crabgrass will thrive when turf grass is short.

BAHIA

HENBIT

CLOVER

DANDELION

If these weeds appear, and other various broadleaf weeds, you can spray post-emergent chemicals like Trimec or Three Way.

All Weeds above can be reduced by applying two pre-emergents. First Application should be applied around Valentines Day. Second Application should be applied about 7 weeks after the first. timing is everything!! Please contact us if you have any questions or would like to sign up today for a full service maintenance contract.

WHAT YOU CAN DO AS A HOMEOWNER

Please Note: (For those who maintain their own residence)

- Assuming you applied the 1st application of pre-emergent If you have not, you can now apply this application as soon as possible (remember to water in).
- Apply water to your turf and flower beds according to the restrictions established by your municipality.
- Refresh your mulch beds
- Plant summer annuals
- Turn on irrigation system and adjust

With nearly 15 years of service in North Carolina and a highly skilled staff of over 150 employees, Yard-Nique is able to respond to any landscape need. Our professional staff is prepared to assist you with design services, new installations, renovations and ongoing maintenance. Whether your job is a SMALL residential renovation project or a MAJOR commercial site, we deliver high quality and honest service at a fair and competitive price.
